

# Introducing the LS Series

The LS Series of Processing Equipment is used to not only make a Lime/Slurry product that meets most state required specifications, but also to mix the slurry with the appropriate aggregates either for on-site marination or for instant use in the asphalt plant production.

This new series of equipment includes one Lime/Slurry Mixing Trailer with a water supply tank, slurry mixing tank and water metering devices, and a slurry flow metering system which manufactures the Lime/Slurry product and supplies it to the pugmill for addition to the virgin aggregate. In addition, the system includes (1) Lime Storage/Feed Silo which supplies the required amount of lime to the slurry making process, and (1) Aggregate Feed/Pugmill Trailer which includes a twin shaft pugmill to properly mix the lime slurry and the virgin aggregates to provide an asphalt plant ready product.

The complete process is controlled by a state-of-the-art computer control system which includes daily recording keeping via either hard copy printer interface or 3-1/2 " computer disk for ease of transferring data to a remote location.
